

# LADYLIFT

Because femininity is timeless.

A new and innovative technique combines the action of the infrared laser and the Ladylift handpiece in order to accelerate the production and the remodeling of mucosa's collagen.

1

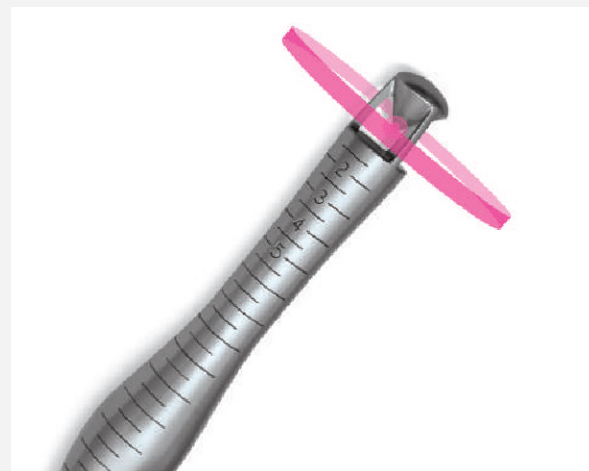

## What is the LADYLIFT?

The LADYLIFT is a vaginal rejuvenation laser treatment. The LADYLIFT's main indications include: to correct/improve vaginal atrophy, to tighten the vagina and to correct/improve stress urinary incontinence.

Other symptoms to be treated include: vaginal dryness, burning, irritation, dryness and the sensation of pain and/or itching during the sexual intercourse.

In this treatment, a diode laser is used to emit an infrared light that penetrates the deeper tissues, without altering the superficial tissue. The treatment is non-ablative, therefore absolutely safe.

The result is toned tissue and a thickening of the vaginal mucosa.

2

## What happens during a LADYLIFT treatment?

During the treatment, a sterile handpiece and laser fiber are used. The unique LADYLIFT laser fiber emits energy from all directions of the fiber – a total 360° emission, rather than only targeting one part of the tissue at a time.

The desired tissue is treated safely and quickly without damaging the basal membrane.

The treatment stimulates neocollagenesis, resulting in toned tissue.

3

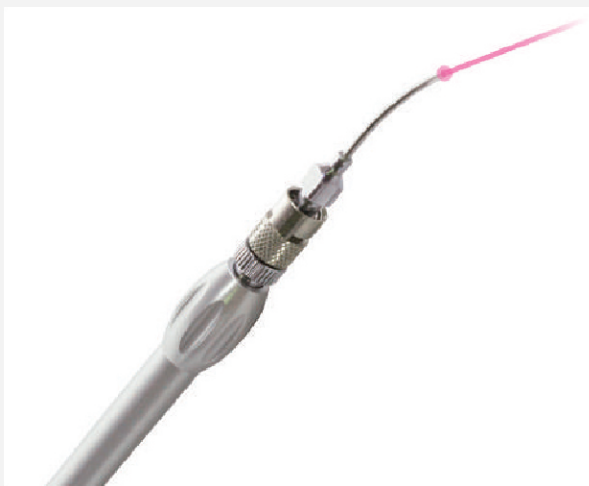

## How long is the treatment?

The treatment only lasts a few minutes and is repeated four times with 15-20 day intervals.

4

## Is the treatment painful?

This treatment is very comfortable! The laser penetrates deeply into the tissue without damaging the delicate superficial tissue. It is a non-ablative procedure, so special post-treatment care is not required.

### APPLICATIONS:

- Vaginal atrophy
- Urinary incontinence
- Vaginal laxity
- Diseases associated to postpartum alteration
- Vaginal rejuvenation
- HPV
- Cysts
- Treatment of scars
- Dryness
- Itching

### ADVANTAGES:

- Fully outpatient process without anesthesia
- No side effects
- Effective and painless
- Non-invasive
